Hello there, my name is Alexa Javellana. I am a Front End Engineer and Digital Creative, with over 6 years of experience building frontends for organizations worldwide. With an eye for visual harmony and a skillset able to accommodate all types of technical complexity, please enjoy this artful representation of the growing arsenal of projects I've had the chance to work on at your leisure.

I look forward to working with you.

### Feature Releases for Sports on Amazon

#### DESCRIPTION

A large project that underwent development from September of 2024 until present, I facilitated frontend development for Amazon Prime Video FireTV integrations with their newly contract sports partner, FanDuel.

The project, in cross-collaboration with Amazon UI and UX design, Legal and Product, integrated a new suite of multimedia features directly within the Amazon Prime Video livestream media object, owned and continuously managed separately with my team.

VISUAL EXAMPLES BELOW  
ALL FROM PRIME VIDEO

#### ACTIONS

My involvement was heavy and covered a wide range of responsibilities:

- Collaborated with backend engineers to define data translation logic to work with in line with output from Java compilation, Smithy models, and Kotlin ingestions
- Bridged any gaps in design and technical feasibility with internal and external teams weekly
- Worked in parallel with other Prime Video teams to discuss ownership and dependency control with existing Prime Video media feature libraries
- Set coding standards for our Kotlin repository for the Sports Betting Feature Suite

#### RESULTS

Launched in early 2025, the FanDuel on Prime Video launch became an accessible, interactive live attraction for over 3.1 millions of sports viewers, enabled for WNBA and NBA games in the Americas, and opened the door for over 12 million FanDuel users to utilize Amazon for their sports betting needs.

The new feature enabled increased viewer engagement in live betting, with on-screen prompts and live bet tracking visualizations targeting every .3 seconds in a live game, where bets in the multitudes of 10s could be placed for both player and team spread, parlay, point counts, etc.

### Localization and Art For Prime Video Metadata

#### DESCRIPTION

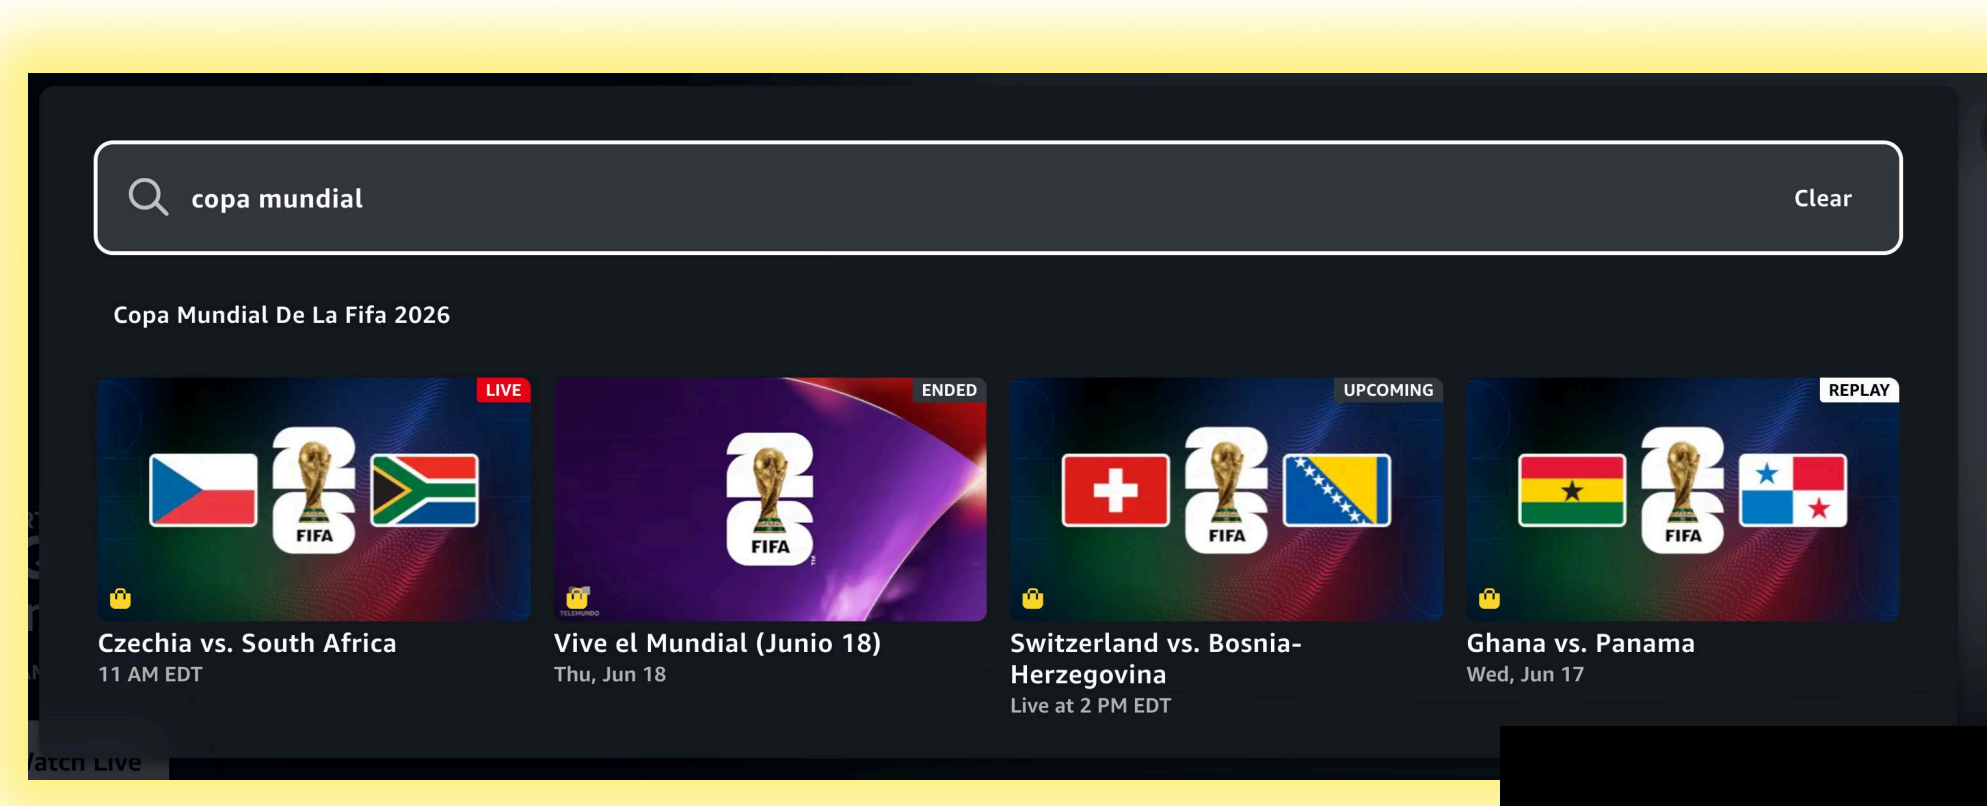

Millions of items, events, and livestreams live on Amazon. Across nations and continents, in different languages and on different displays.

A sporting or music event could be broadcast anywhere in the world, in different countries where English is not their default language. Behind the scenes, applying language-specific titles, descriptions and other useful searchable metadata to a group of events took an unsurmountable amount of time and effort, and could not be done in batch with prior technology back in 2021.

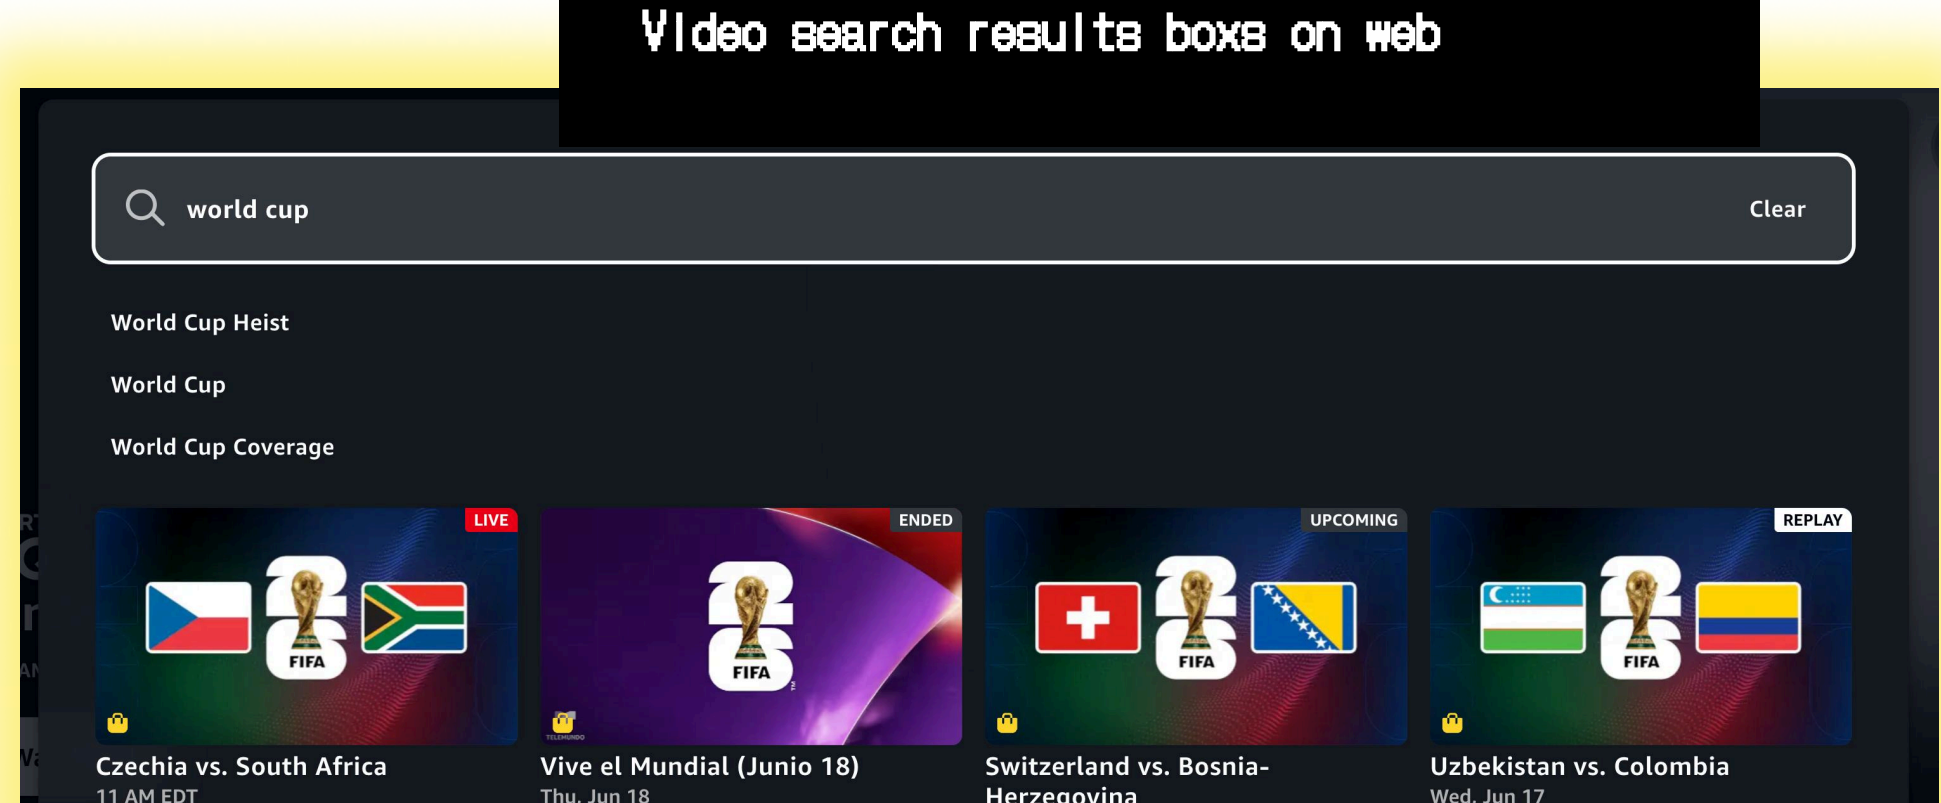

The team at Amazon Prime wanted to tackle this problem head on: Was there a way we could improve our current workstreams by allowing authorized users the ability to apply both default and localized, language specific details and artwork associated to an event on upload and publication to Prime Video?

Events broadcasted on Amazon Prime Video should return the same ranking of search results for equivalent terms in any languages

FIFA WORLD CUP 2026

An example of the English equivalent to "copa mundial", or "world up" events served as suggestions in the Amazon Prime Video search results boxes on web

You could see how for one event, there could be localized equivalents in multiple languages, around 50+ supported on Prime Video

#### ACTIONS

- Collaborated with Product and Launch Management teams to understand the pain points of non-technical users when it came to manual processing of localized, language-specific metadata association to an event they were to publish on Prime Video
- Took these concerns and turned them into front end technical requirements to build a new product tool of off
- Produced wireframes to illustrate the minimum viable product and approach to incorporating existing Amazon design and tooling visual patterns so incorporation would be easier
- Informed other engineers and other parallel teams about the backend work necessary to enable these new functionalities, creating API-related tasks and documentation about what was needed

#### RESULTS

After design, requirement gathering, and development, I launched new ReactJS/TypeScript based features onto Amazon tooling libraries that

- allowed user-friendly batch metadata application to a multiple number of events instead of only one at a time, for all categories of events, which could affect up to hundreds of events under tournaments, leagues, etc.
- introduced the option to set default values for events in batch
- overall, decreased manual overhead by almost up to 80-90%, reducing effort for multi-application for over 3,000+ events weekly
